

Hidden Risks of Biometric Identifiers and How to Avoid Them

Dr. Thomas P. Keenan, FCIPS, I.S.P., ITCP
Professor, University of Calgary
Research Fellow, Canadian Global Affairs Institute
keenan@ucalgary.ca

Las Vegas, NV August 3, 2015

IN THE NEXT HOUR, YOU WILL LEARN

- Why biometrics are about to become very important in your job and your life
- How it will have subtle consequences that people aren't talking about yet
- Some creepy biometric ideas that are “just around the corner”
- How you can get ready for the biometric revolution
- But first, if biometric technologies are the solution -- what is the problem?

HOW BAD IS THE “PASSWORD PROBLEM”?

I remember when your password was physical possession of the computer!

Image: Wikimedia Commons CC-BY-SA-3.0

NOW COMEDIANS MAKE JOKES ABOUT THEM, AND USERS ARE FRUSTRATED

- “I needed a password eight characters long so I picked Snow White and the Seven Dwarves” – Comedian Nick Helm
- Computer: Please enter a new password
User: cabbage
Computer: Sorry, the password must be more than 8 characters

User: boiled cabbage

Computer: Sorry, the password must contain 1 numerical character

User: 1 boiled cabbage

Computer: Sorry, the password cannot have blank spaces

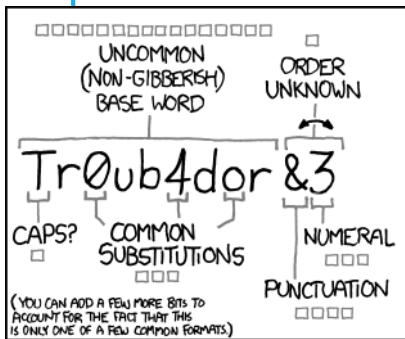

/* time passes and much effort is expended */

User: Now I Am Getting Really P****d Off 50 F****ing Boiled Cabbages Shove
d Up Your A** If You Dont Give Me Access Immediately

Computer: Sorry, that password is already in use!

AND OF COURSE XKCD WEIGHS IN

~28 BITS OF ENTROPY

$2^{28} = 3 \text{ DAYS AT } 1000 \text{ GUESSES/SEC}$

(PLAUSIBLE ATTACK ON A WEAK REMOTE WEB SERVICE: YES, CRACKING A STOLEN HASH IS FASTER, BUT IT'S NOT WHAT THE AVERAGE USER SHOULD WORRY ABOUT.)

DIFFICULTY TO GUESS: **EASY**

WAS IT TROMBONE? NO, TROUBADOR. AND ONE OF THE 0s WAS A ZERO?

AND THERE WAS SOME SYMBOL...

DIFFICULTY TO REMEMBER: **HARD**

~44 BITS OF ENTROPY

$2^{44} = 550 \text{ YEARS AT } 1000 \text{ GUESSES/SEC}$

DIFFICULTY TO GUESS: **HARD**

THAT'S A BATTERY STAPLE.

CORRECT!

DIFFICULTY TO REMEMBER: YOU'VE ALREADY MEMORIZED IT

THROUGH 20 YEARS OF EFFORT, WE'VE SUCCESSFULLY TRAINED EVERYONE TO USE PASSWORDS THAT ARE HARD FOR HUMANS TO REMEMBER, BUT EASY FOR COMPUTERS TO GUESS.

A CRYPTO NERD'S IMAGINATION:

HIS LAPTOP'S ENCRYPTED. LET'S BUILD A MILLION-DOLLAR CLUSTER TO CRACK IT.

NO GOOD! IT'S 4096-BIT RSA!

BLAST! OUR EVIL PLAN IS FOILED!

WHAT WOULD ACTUALLY HAPPEN:

HIS LAPTOP'S ENCRYPTED. DRUG HIM AND HIT HIM WITH THIS \$5 WRENCH UNTIL HE TELLS US THE PASSWORD.

GOT IT.

BIOMETRICS IS POISED FOR HUGE GROWTH

Biometrics Research Group Inc. projects that the global biometrics market will grow to \$15 billion by 2015 from its 2012 estimated value of \$7 billion.

(www.biometricupdate.com/research)

It is moving into every sector from banking to healthcare to retail, and will play a "killer app" role in enabling mobile commerce

WHY BIOMETRICS WILL RULE THE WORLD

Passwords are indeed severely broken

Convenience is king – you never forget to bring your finger or face

Technology is getting better

Biometrics are more difficult to copy than, e.g. passwords or CC numbers

Biometrics are difficult to share

Some attention is being paid to privacy, e.g. hashes and not full biometrics are usually collected

Legal/Financial forces are pushing for non-repudiatable ID

- Oct 1, 2015: USA Fraud liability shifts to non-chip merchants
- Already in Canada: consumer liable if PIN entered

WHY BIOMETRICS WILL CREEP PEOPLE OUT

It's so "you" — you can't change your fingerprint or retinal scan like you can a credit card number

Snowden revelations about Government Tracking

Business Tracking:

- "Target Knows Teen is pregnant" is a great yarn but there are more realistic predictive analytic business cases (divorce prediction; likelihood you'll switch insurers; creditworthiness via your friends)
- FBX and the like: I'm being pursued by a wall oven and a rental car
- "Smart shelves" in supermarkets that guess your age, gender, BMI

A VERY BRIEF HISTORY OF BIOMETRICS

- 31,000 years ago: Handprint “signed” cave paintings
- 500 BC Fingerprints on Babylonian clay tablets
- 1892 Galton develops fingerprint classification system
- 1959 LAPD catalogs “tattoos and identifying marks”
- 1994 First iris recognition algorithm patented
- 1994-1999 FBI develops and launches IAFIS (fingerprints)
- 1998 FBI launches CODIS (DNA database)
- 2001 Face recognition tested at Superbowl in Tampa
- 2003 ICAO supports machine readable travel documents
- 2004 US VISIT program becomes operational

HIDDEN RISK #1: BIOMETRIC RELIABILITY AND THE PERCEPTION OF IT

- WE know that technology is only right some of the time
- The general public sees it as “all or nothing”

September 23, 2014

Why I hacked TouchID (again) and still think it's awesome

By Marc Rogers 11 Comments  190  234

Last year, when the iPhone 5S was released, I showed how you could hack its fancy new TouchID fingerprint sensor. A year and one iPhone 6 later, I've done it again.

Conclusion

Just like its predecessor — the iPhone 5s — the iPhone 6's TouchID sensor can be hacked. However, the sky isn't falling. The attack requires skill, patience, and a really good copy of someone's fingerprint — any old smudge won't work.

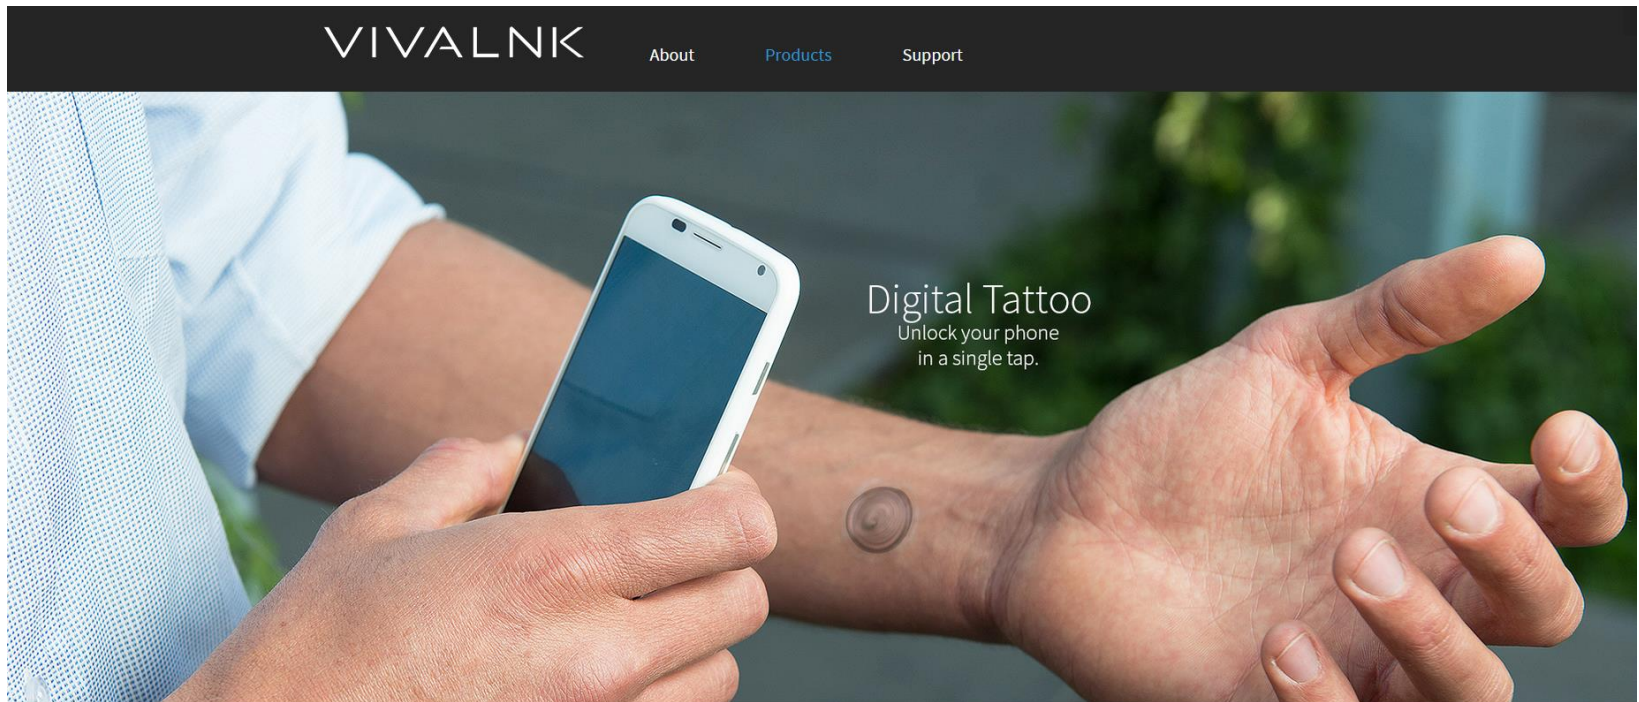

Source: <https://blog.lookout.com/blog/2014/09/23/iphone-6-touchid-hack/>

HIDDEN RISK #2: LACK OF DISCUSSION OF THE CONSEQUENCES OF ERRORS

- In Biometrics, by convention:
 - Type I Error: False Reject Rate (doesn't allow valid access)
 - Type II Error: False Accept Rate (allows access when it should not)
 - Crossover Error Rate (point at which $FRR = FAR$, “neutrality”)
- Consequences of your iPhone not recognizing you or accepting an imposter? It depends!
- Consequence of the Nexus terminal mis-identifying travelers? Probably low since they were all on the trusted traveler list to begin with
- The point is that Type I and Type II errors are usually hidden in technical specs (if they are considered at all) but can have important policy implications

COUPLING AN ELECTRONIC SKIN TATTOO TO A MOBILE COMMUNICATION DEVICE

Abstract

A system and method provides auxiliary voice input to a mobile communication device (MCD). The system comprises an electronic skin tattoo capable of being applied to a throat region of a body. The electronic skin tattoo can include an embedded microphone; a transceiver for enabling wireless communication with the MCD; and a power supply configured to receive energizing signals from a personal area network associated with the MCD. A controller is communicatively coupled to the power supply. The controller can be configured to receive a signal from the MCD to initiate reception of an audio stream picked up from the throat region of the body for subsequent audio detection by the MCD under an improved signal-to-noise ratio than without the employment of the electronic skin tattoo.

HERE COME THE DIGITAL BLOODHOUNDS

Body odor as a biometric identifier

Researchers at the UPM along with the Ilía Sistemas company are making progress on the development of a new biometric technique that would allow us to identify people through their personal odor.

The research of the Group of Biometrics, Biosignals and Security (GB2S) of the Universidad Politécnica de Madrid (UPM) in collaboration with Ilía Sistemas SL unveils that there are recognizable patterns of each person's body odor that remain steady. Therefore, every person has his/hers own odor and this would allow his/her identification within a group of people at an accurate rate higher than 85%. This result leads the way to improve personal identification that is less aggressive than other biometric techniques being used today.

Nowadays, our identity verification in most airports or border checkpoints is based on our physical resemblance to our ID card or passport photo. Even though the new electronic passports are difficult to forge, the usage of biometric techniques based on a person's physical features would increase the safety effectiveness of the border control checkpoints.

Source: UPM

Several biometric techniques like the iris and fingerprint have a low error rate. However, these two techniques are usually related to criminal records and for this reason when a person is required to identify himself is reticent to collaborate. On the other hand, other recognized biometric techniques like the face recognition have a high error rate. Therefore, the development of new sensors that allow the capture of body odor can provide a less aggressive solution because the identification could be at the same time when crossing the system stall.

WHAT IS THERMAL IMAGING

The Electromagnetic Spectrum

Thermal imaging is one of the most powerful technologies ever developed to enhance human vision.

Normally, our vision is limited to a very small portion of the electromagnetic spectrum. Thermal energy has a much longer wavelength than visible light. So long, in fact, that the human eye can't even see it, just like we can't see radio waves.

With thermal imaging, the portion of the spectrum we perceive is dramatically expanded, helping us "see" heat. Visible light doesn't affect the thermal world, so you can see equally well in highly lit and totally dark environments.

Anonymous sperm donor traced on internet

New Scientist, 03 November 2005
ALISON MOTLUK

LATE last year, a 15-year-old boy rubbed a swab along the inside of his cheek, popped it into a vial and sent it off to an online genealogy DNA-testing service. But unlike most people who contact the service, he was not interested in sketching the far reaches of his family tree. His mother had conceived using donor sperm and he wanted to track down his genetic father.

That the boy succeeded using only the DNA test, genealogical records and some internet searches has huge implications for the hundreds of thousands of people who were conceived using donor sperm. With the explosion of information about genetic inheritance, any man who has donated sperm could potentially be found by his biological offspring. Absent and unknown fathers will also become easier to trace.

Genentech Announces
Partnership with
23andMe

HIDDEN RISK #3: BIOMETRIC DATA'S IRREVERSIBILITY AND THE IMPLICATIONS

- For biometrics such as your DNA cheek swab, it is usually infeasible to withdraw access, once granted.
- Even if taking a sample/hash of a physical feature (features on a fingerprint, selected SNPs of the DNA) there is always the danger of “data jigsawing”
- Legal protection of biometric data is highly variable by jurisdiction
- If credit card numbers are dynamite to have in your possession, DNA data is nuclear fuel!

NEWEST VULNERABILITY: YOUR FACE!

Black Hat: Facial recognition software can link your face to your social security number

Aug. 3, 2011 (1:35 pm) By: *Jennifer Bergen*

The annual Black Hat security conference is in full swing right now in Las Vegas. The conference, which started on July 30 and goes to August 4, is *the* place to be for security researchers to discuss and learn about different types of security vulnerabilities seen in almost every area of technology. One area of security that touches close to home for everyone is the privacy of our personal data being linked to our faces. Specifically, information can be linked to your face and made available to anyone who snaps your picture with their smartphone camera.

With major companies like Apple offering face detection APIs to developers in iOS 5, the method of taking a picture and having a database recognize the person's face is available, and over the years, it will only get more and more advanced.

NAMETAG APP

EVEN HOW WE WALK IS BEING STUDIED

“Human gaits, for example, can provide a lot of information about people’s intentions. At the American Army’s Aberdeen Proving Ground in Maryland, a team of gait analysts and psychologists led by Frank Morelli study video, much of it conveniently posted on the internet by insurgents in Afghanistan and Iraq.”

-The Economist, Oct. 2008

HIDDEN RISK #4: OUR BIOMETRICS CAN BE GRABBED WITHOUT OUR CONSENT

- In a public place, and even some “private” spaces, we are exposed
- Face
- Gait
- Speech
- Behavior

New surveillance cameras will use computer eyes to find 'pre crimes' by detecting suspicious behaviour and calling for guards

- Computerised detectors look for 'abnormal' behaviour
- When suspicious individuals are seen, guards called
- BRS machines have been trialled in numerous locations
- 288 cameras to be installed on subway in Sn Francisco

By ROB WAUGH

PUBLISHED: 13:12 GMT, 5 June 2012 | UPDATED: 13:12 GMT, 5 June 2012

[Comments \(24\)](#) | [Share](#) [+1](#) 26 [Tweet](#) 191 [Like](#) 3.5k

A new generation of computerised 'Big Brother' cameras are able to spot if you are a terrorist or a criminal - before you even commit a crime.

The devices are installed in places like train stations or public buildings where they scan passers by to see if they are acting suspiciously.

Using a range of in-built parameters of what is 'normal' the cameras then send a text message to a human guard to issue an alert - or call them.

Creepy talking (and listening) surveillance cameras are here

5/15/2012

Tricked out street lights incorporating "homeland security applications" that can bark orders at passers-by are being installed in major U.S cities. While this could make your next excursion into the city streets much more exciting, critics are warning the "IntelliStreets system" is a Big Brother step too far. The system includes a variety of cameras and sensors, and perhaps more worryingly, can record conversations. IntelliStreets connects via Wi-Fi and is currently being rolled out in Detroit, Chicago and Pittsburgh, with manufacturers saying it's also suitable for "retail malls, sports venues, on college campuses, and in new construction."

HIDDEN RISK #5: OUR BEHAVIOR CAN RAT US OUT – SOMETIMES INCORRECTLY

- DHS FAST system -- ridiculed at DEFCON 19 (2011) by teenagers

Source: Wikipedia.org which says "Department of Homeland Security, Science and Technology Department - Sharkride.com but apparently ultimately from a now down DHS website" (unable to authenticate)

3D BIOMETRIC IMAGING

Biometric Imaging

Biometrics

Methods for uniquely recognizing humans based upon one or more intrinsic physical or behavioral traits.

Biometrics comprises methods for uniquely recognizing humans based upon one or more intrinsic physical or behavioral traits. Biometric recognition enabled systems are used as a form of secure identity access management and access control. It is also used to identify individuals in groups that are under surveillance.

Standoff Biometrics is the ability to collect biometric data, overtly or covertly, from a distance.

Biometric characteristics can be divided in two main classes:

Physiological Biometrics are related to the shape of the body. Examples include, but are not limited to facial and iris recognition, hand - palm geometry and fingerprints.

Behavioral Biometrics are related to the behavior of a person. Examples include, but are not limited to body posture movement, gait and micro-expressions.

GOOD MEMORIES, BAD MEMORIES, FALSE MEMORIES COURTESY OF

Solicitation Number:

DARPA-BAA-12-03

Notice Type:

Presolicitation

Synopsis:

Added: Oct 07, 2011 1:11 pm

DARPA is soliciting innovative research proposals in the areas of (1) quantitative analysis of narratives, (2) understanding the effects narratives have on human psychology and its affiliated neurobiology, and (3) modeling, simulating, and sensing-especially in stand-off modalities-these narrative influences. Proposers to this effort will be expected to revolutionize the study of narratives and narrative influence by advancing narrative analysis and neuroscience so as to create new narrative influence sensors, doubling status quo capacity to forecast narrative influence.

RISK #6: GIVING OUR BIOMETRIC AND BEHAVIORAL DATA MAY BE (*DE FACTO*) MANDATORY

- In India, biometric ID is legally mandated and needed to obtain government services.
- You can rent a car without a credit card (but just try to!)
- You can also ask for a paper ticket at a Disney theme park instead of this:

Your Fuelband Knows When You're Having Sex

Adam Clark Estes

Filed to: SEX 7/12/13 12:42pm

109,375

4

Source: gizmodo.com

Everybody loves these Fuelbands and other activity trackers because they supply you with troves of data about your everyday life. Sometimes, however, it's a little bit too much information.

Your fitness wristband knows when you're having sex. If it's sensitive enough to detect minute movements while you're sleeping, it can certainly pick up on the patterns of intercourse. Plus how else do you explain getting a half hour of exercise late at night without taking a single step.

WORKPLACE ISSUES

Companies are giving fitness monitors and other wearable to employees as part of fitness programs

“Four out of five employees would use company-provided wearable that tracks health and wellness and provide that data to their employer.”

(<http://www.cornerstoneondemand.com/SOWP14>)

Perks might include discounts on fitness programs, extra vacations days, a bonus

BUT... Did you get a good night's sleep? Or...

Source: Licensed from Colourbox

HIDDEN RISK #7: BIOMETRIC DATA THIEVES AND AGGEGATORS

- Like any other data, biometric data is subject to breach, hacking, being held for ransom
- “Bits is bits” so why wouldn’t companies Acxiom (and Google) try to grab biometric data (if they are allowed to)
- Well the good news is that there is, at least, some awareness of the ethical issues:

Employing Sensitive Data for Marketing and Advertising

Historically, the marketing industry had simple definitions for sensitive data. It was data about children, data about health, and data about finances. Today there are all kinds of new sensitive data, such as location data and biometric data (e.g., facial recognition data), which can be very revealing about our activities and relationships. What’s more, through sophisticated analytics, companies can take data that is not sensitive at all and predict, to a high degree of accuracy, very sensitive insights about individuals, such as whether they are pregnant, what kinds of diseases they are likely to have or develop in the future, and what their financial situation is.

Source: acxiom.com

A FRAMEWORK FOR MAKING ALL THIS “NEWS YOU CAN USE”

Even before you get back to the office, list technologies that you use or are considering using that have biometric components

Apply this “creepy lens” to identify ways in which it might upset people or compromise their privacy or confidence

Think about alternatives that will produce “pretty good information” A sign-in sheet at the company gym will track attendance, if not effort, as well as a fitness band. What do you really need to collect?

LONGER TERM APPLICATION OF WHAT YOU HAVE LEARNED TODAY

Check your data retention policies (example: videotapes should usually be erased after 7 days if not requested)

Consider whether some data should be de-identified (which can be difficult!) or collected anonymously or not at all

View every new technology through the creepy lens and make sure the benefits outweigh the risks

Don't Be Creepy!

THANK YOU!
